

PROPELLER PROBLEMS COULD BE “CURED” *at the SILLETTE Propeller Clinic*

Lack of power, sluggish performance, poor control in reverse..... these are all problems which might be caused by the wrong propeller!

Sillette Marine Propulsion will be running a “Propeller Clinic” from their 2010 London International Boat Show Stand no. SO27A, where experts from the company will be on hand to “diagnose” problems and offer cures!

It would help if “patients” came armed with full details of their boat plus engine model, horsepower and gear ratio.

The company hold over 2,000 propellers (2 and 3 blade, fixed and folding in bronze and alloy) in stock and represent Gori and Eliche Radice in the UK and Ireland. They also have full, in-house engineering facilities enabling them to custom machine just about any prop or shaft to meet customers’ requirements.

Of course propellers are not the only thing Sillette are good at. Their stand is a great place to visit to discuss all aspects of marine propulsion including stern drives, shafts, seals etc., in fact almost anything to do with that part of boats.

Oh, and for the green boaters the stand is the place to see a superb, quiet, efficient, electric sail drive.
